

THE WORLD OF HANDMADE PREMIUM CIGARS

Scandinavian Tobacco Group — De las semillas al consumidor
Transcripción de texto de la presentación (incluye el contenido de los diagramas)

CÓMO STG ASEGURA UNA EXPERIENCIA DE FUMADO CONSISTENTE

(How STG secure consistent smoking experience)

People	Tobacco	Quality	Socially responsible
A safe work place Skilled labor Competitive pay	Deepest & diverse tobacco inventory	Stick to our promise We believe in fermenting and aging We believe in consistency	Believe in protecting the environment & promote well-being of our employees and local communities

STG PRINCIPLES AND VALUES

The People – Our Most Important Asset

Cigar making is an art – the quality of our product is at large on the hands of our artisans.

- Highly skilled artisans
- Passionate individuals
- Committed and loyal employees

Our Tobaccos – Along with People, the Most Important Asset

A sound and deep tobacco inventory is key to quality and consistency.

- STG holds the largest and most diverse tobacco inventory of the industry.
- STG carries types and seeds from every growing region.

OUR MOST IMPORTANT ASSETS — OUR TOBACCOS

Type	Country	Cigar Brand
Amazonian	Brazil	CAO Amazon Series
Arapiraca	Brazil	CAO Brazilia, CAO Mac Inspirado Green
Bezuki	Indonesia	COHIBA / H Honey / Torano The Brick
Broad Leaf	USA	CAO Flathead / CAO Bones / COH Black
Colombian	Colombia	CAO Colombia / Serie R Esteli
Corojo	Ecuador	Punch Signature
CT Shade	Ecuador	Cohiba Connecticut / CAO Gold
CT Shade	Honduras	LGC Retro / S. Panza
CT Shade	USA	Mac Café / Excalibur
Havana	Ecuador	COHIBA Spectre / Cru Royal / CAO Pilon
Havana CT	USA	CAO Steel Horse / CAO Session
Havano Condega	Nicaragua	CAO Flathead / Punch Signature
Havano Esteli	Nicaragua	LGC, CAO line, Punch
Habano Jalapa	Nicaragua	LGC Spanish Press, Cohiba Connecticut

Havano Jamastran	Honduras	Coh Nic / Mac Inspirado Orange
Havano La Entrada	Honduras	Punch
Havano Ometepe	Nicaragua	Don Tomas / Mac Inspirado Orange
Havano OSA	Honduras	Mac 1968 / Don Tomas / Mac Insp
KY 171	USA	Hoyo / Foundry
Matafina/MN	Brazil	Cao Colombia / Serie R Black
Native Cameroon	Cameroon	Cohiba / Partagas
Negro San Andres	Mexico	Mac / Par / Serie R Estelí / CAO Zocalo
Olor	Dominican	LGC Spanish Press
Paraguay	Paraguay	Foundry
Peru	Peru	N/A
Piloto Cubano	Dominican	Mac Café / Cohiba / Partagas
Sumatra	Mexico	Macanudo
Sumatra	Ecuador	Punch / Serie R / LGC

II. TOBACCO GROWING (CULTIVO DEL TABACO)

Seedling (almácigo)

- Tiny coated seeds are planted into a growing medium where they germinate.
- It takes 38-42 days for the seedling to grow and be ready for transplanting to the field.
- Seedlings are transplanted to the field – by hand or by machine.

Transplanting & Growing

- Growing requires several agricultural practices: *hoeing, suckering, topping, harvesting and sewing*.
- It takes around 105 days to grow wrapper.
- Growing filler and binder takes from 80-85 days.

Structure of the Tobacco Plant (contenido del diagrama)

De arriba hacia abajo, por corte (priming), con su denominación y la clase de hoja:

Corte (priming)	Denominación	Clase de hoja
Sixth priming	Corona	Ligero — 35%
Fifth priming	Centro Alto	Ligero — 35%
Fourth priming	Centro Medio	Seco — 45%
Third priming	Centro Bajo	Seco — 45%
Second priming	1 1/2	Seco — 45%
First priming	Libre pie	Volado — 25%
Sandleafs	Barre Suelo	Volado — 25%

Nota: los porcentajes Ligero 35% / Seco 45% / Volado 25% aparecen en el diagrama asociados a las bandas de altura de la planta; las llaves abarcan varios cortes, por lo que la asignación por fila es aproximada.

Nicotine & Sugar Content (contenido del diagrama)

“Nicotine is the active ingredient of tobacco responsible for its peculiarity.” La nicotina aumenta hacia la parte alta de la planta y el azúcar hacia la parte baja.

Posición en la planta (de arriba a abajo)	Nicotina	Azúcar
---	----------	--------

Superior	4%	5%
		15%
Medio-alto	3,5%	20%
Medio	3%	
Medio-bajo	2%	25%
Inferior	1%	15% / 5%

Harvesting

- Harvesting begins when leaves are ripe, 50-55 days after transplanting.
- Leaves are picked on a weekly basis, two or three at a time (*priming*), starting from the bottom of the plant.

Curing

- Curing is the process of drying out tobacco leaves after harvesting (*water content drops from 85 to 30%*).
- It takes around six weeks and in the process leaves turn from green to brown color.
- There are different curing methods: *air-cured, fire-cured, flue-cured, sun-cured*.

III. TOBACCO PROCESSING (PROCESAMIENTO)

The purpose of tobacco processing is to provide the raw tobacco leaf the *fermentation, grading and aging* to bring out its **true taste and aroma** and to obtain **uniform tobacco leaves**.

Fermentation

- Improves taste and aroma
- Decreases level of ammonia, sugar & nicotine
- Improves burning capability
- Enhances appearance of the leaf

Leaf Sorting

- Tobacco leaves are classified into wrapper, binder & filler.
- Leaves are then **categorized** by color, quality grades, and sizes.

Wrapper Leaf – Color Range

- The color of wrapper partially defines the identity of the product.
- Color is related to texture, strength profile and flavor of the leaf.

Color range	Tono	Flavor profile
Double Claro / CANDELA	Greenish	Sweet
CLARO	Light Tan	Mild
COLORADO CLARO	Brown	Smooth medium
COLORADO	Reddish Brown	Strong & Spicy
COLORADO MAD	Dark Brown	Aromatic, rich medium
MADURO	Brown to Black	Sweet & strong flavor
OSCURO	Black	Strong body profile

Leaf Aging

- Leaves are then **aged** for one to two years.

III. CIGAR MANUFACTURING (FABRICACIÓN DEL CIGARRO)

STG is committed to make the best cigars in the industry. Every cigar is manufactured as if it were the only one in the world. Therefore, they are manufactured to be **the best in their category**.

Blending

Blending is the **combination** of different types and grades of tobacco leaves in order to achieve a predetermined aroma, taste and strength profiles.

Bunching

Bunching consists of folding different filler leaves into a tube-like shape and then wrapping them with a binder.

Rolling

Cigar rolling consists of wrapping the bunch with the wrapper leaf. The wrapper determines the appearance of the cigar and most of the cigar's character and flavor.

Quality Control

Quality control takes place at every single step of tobacco and cigar manufacturing processes. Key metrics are as follows:

- Level of moisture
- Color and texture
- Cigar construction & appearance
- Draw and burning capability

Cigar Aging

- Cigars are placed in a cedar-lined room to undergo at least one month of **aging**.
- Cigars reach proper humidity level & release ammonia.
- Enhance flavor and aroma & improve burn.

Cigar Packing

- **Shading** – prior to packing each cigar is sorted by color and tones to assure all cigars in same box pertain to same color range.
- **Banding & Cello** – after shading bands are applied and cigars are placed into cellophane, glass or aluminum tubes prior to final packing.

Deep Freezing & Shipping

- After packing cigars undergo a deep-freezing process before shipping them to our Distribution Center.
- This process guarantees cigars shipped are free of beetles.

IV. BOX MANUFACTURING (FABRICACIÓN DE CAJAS)

Box Factory – Outstanding Box Factory facilities.

- Embrace lean culture
- Safety is key

- Around 85% of the boxes we need are produced internally

Thank you!
